# Module 03: Perception in Hs

## Learning Objectives

1. Define **Perception** within the context of Hs.
2. Analyze how Perception interacts with other components of the Active Inference framework.
3. Apply specific constraints of Hs to the formal definition of Perception.

## Introduction

This module explores **Perception**. In the **Hs** curriculum, we approach this topic with a focus on specific applications and theoretical depth appropriate for the audience. Perception is a critical component of the 8-part Active Inference spine, bridging the gap between [Previous Topic] and [Next Topic].

## Key Concepts

### 1. Perception as a Markov Blanket Boundary

How does Perception define the boundary between the agent and the environment?

### 2. Generative Models of Perception

What parameters involved in Perception must be optimized to minimize variational free energy?

### 3. Active Inference Dynamics

How does the process of Perception drive the perception-action loop?

## Applications

In Hs, we see Perception manifest in: * **Specific Example 1**: [Add domain-specific example here] * **Specific Example 2**: [Add domain-specific example here]

## Conclusion

Understanding Perception allows us to better model complex adaptive systems. In the next module, we will expand on this foundation.
