

Lab: The Broken Maze

Goal

To fix a broken set of instructions (Debug).

What You Need

- Paper and pencil.
- A simple maze drawn on paper.

Steps

1. Write the Code

Write instructions to get through the maze.

- "Forward 2."
- "Turn Right."
- "Forward 1."

2. Insert a Bug

Purposefully change one instruction to be WRONG. Change "Turn Right" to "Turn Left."

3. Run the Code (Debug)

Give the instructions to a friend. Watch them hit a wall. "Error! Wall detected!" NOW... find the line of code that caused the crash. Fix it.

Discussion

- Was it easy to spot the bug?
- Sometimes bugs are hidden deep in the code.

- Programmers spend more time debugging than writing new code!

What We Learned

Debugging is a superpower.
