

Lab: The Cardboard Controller

Goal

To design an ergonomic interface for a human hand.

What You Need

- Cardboard.
- Scissors.
- Bottle caps (Buttons).
- Glue.

Steps

1. The Grip

Cut a shape that fits your hands comfortably. Is it too big? Too small? Where do your thumbs naturally rest?

2. The Layout

Glue bottle caps where the buttons should be. "A" button for thumb. "Triggers" for index fingers. This is **Ergonomics** (Designing for the body).

3. The Test

Hold it. Pretend to play. Do your fingers get tired? Can you reach all the buttons? Real designers make hundreds of prototypes like this.

Discussion

- Why are almost all controllers the same shape? (Because human hands are the same shape).

- What would a controller for a cat look like?

What We Learned

Interfaces must be designed for the Agent's body.
