

Practice Quiz: Strategic Modeling — Module 03:

Perception

Name: ____ Date: ____

Part A: Multiple Choice

1. Kodak's failure was primarily: A) Technology failure B) Perceptual filtering — the organization's model filtered out the weak signal of digital imaging C) Marketing failure D) Financial mismanagement
 2. **Weak signals** (Ansoff) are: A) Low-volume audio B) Early, ambiguous indicators of significant future changes that require broad, low-precision scanning C) Signals with low amplitude D) Insignificant data
 3. The key difference between tactical and strategic perception is: A) Budget B) Time horizon — tactical senses current market, strategic senses structural shifts C) Team size D) Tools used
 4. **Proximity bias** in strategic perception means: A) Preferring nearby offices B) Over-attending to nearby competitors while missing distant disruptors C) Geographic strategy D) Supply chain focus
 5. A competitive intelligence system must include: A) Only data collection B) Collection, analysis, dissemination, and integration with strategic decisions C) Only monitoring competitors D) Only market research
 6. **Quantification bias** causes organizations to: A) Be too precise B) Ignore qualitative signals that don't fit neat metrics, missing important subjective information C) Over-invest in analytics D) Hire more analysts
 7. Environmental scanning should be: A) Narrow and focused B) Broad enough to catch weak signals from unexpected sources C) Limited to known competitors D) Annual
-

Part B: Short Analysis

1. Your organization's strategic sensing is limited to quarterly financial reports from public competitors. Design a competitive intelligence system that adds weak signal detection, qualitative sensing, and peripheral scanning.
2. A major technology shift is underway in your industry, but your CEO dismisses it as "not relevant to our core business." Using the Kodak case and perceptual blind spots framework, construct an argument and propose a sensing process.
3. Two equally capable competitors face the same market disruption. One detects it 18 months earlier. Analyze how earlier detection translates into strategic advantage and design a sensing system optimized for speed.
