

Practice Quiz: Digital Transformation — Module 02:

Agents

Name: ____ Date: ____

Part A: Multiple Choice

1. The **delegation of inference** to AI systems is best guided by: A) Cost B) Matching task characteristics (volume, complexity, ambiguity) to agent strengths (human judgment vs. AI speed) C) Technology availability D) Employee resistance
 2. Human-AI teams outperform either alone because: A) They're more expensive B) They combine complementary strengths — AI handles volume/consistency, humans handle judgment/novelty C) They're bigger D) AI is always better
 3. AI systems fail differently from humans by: A) Failing less often B) Failing catastrophically on edge cases and distribution shifts rather than gradually through fatigue/bias C) Not failing at all D) Failing more often
 4. **Automation anxiety** is best addressed by: A) Ignoring it B) Transparently communicating how AI augments rather than replaces human roles, and investing in reskilling C) Replacing everyone quickly D) Avoiding AI entirely
 5. An AI **collaborator** differs from an AI **tool** by: A) Being more expensive B) Sharing the inference task rather than just being directed by the human C) Being autonomous D) Being simpler
 6. Effective human-AI collaboration requires humans to: A) Trust AI completely B) Understand AI capabilities, limitations, and failure modes to effectively oversee and complement it C) Ignore AI recommendations D) Let AI make all decisions
 7. When deploying AI agents, the most underestimated challenge is: A) Cost B) The organizational change required — new roles, processes, skills, and culture C) Technical complexity D) Vendor selection
-

Part B: Short Analysis

1. Design a human-AI team for a loan underwriting process. Specify: which decisions are AI-automated, which are human, what escalation triggers exist, and what governance is needed.
2. Your organization plans to deploy an AI customer service chatbot. Analyze the delegation of inference: which customer inquiries should the bot handle autonomously, which should escalate, and how should the handoff work?
3. A team of analysts is anxious about a new AI system that automates much of their routine work. Design a change management approach that addresses their concerns while maximizing the value of the human-AI system.
