

Lab: Program a Parent

Goal

To learn how to give precise instructions (Code) to an Agent.

What You Need

- A "Robot" (A parent or friend).
- A Goal (e.g., Get a glass of water, Walk to the door).

Steps

1. The Challenge

The "Parent Robot" only listens to EXACT commands. They cannot guess!

2. The Code

Give commands one by one:

- "Move Forward 2 steps."
- "Turn Right."
- "Pick up Cup."

3. The Debugging (Fixing Mistakes)

If you say "Pick up Cup" but they are too far away... the Robot will grab air! **Error!** You must fix your code: "Move Forward 1 more step. THEN pick up cup."

My Code Log

Goal	Did it work?	What went wrong?
Walk to door	No	Hit the sofa! Needed to turn left.
Walk to door (Try 2)	Yes!	Perfect code.

What We Learned

Robots aren't smart like people. They are very obedient. They do EXACTLY what you say, even if it is wrong! You have to be a careful programmer.
