

Practice Quiz: Communication (Fiber & Flow)

Part A: Multiple Choice

1. The color wheel functions in the crochet community as: A) A purely decorative tool B) A shared generative model that predicts how colors will interact C) Something only professional designers use D) An outdated concept with no practical value
2. When a yarn label says "Worsted Weight," it communicates: A) Only the price of the yarn B) A compressed package of predictions about gauge, hook size, and project suitability C) That the yarn is old-fashioned D) Nothing useful to the crocheter
3. The fiber content label works as communication because: A) Labels are always perfectly accurate B) Sender and receiver share a generative model of how each fiber behaves C) Fiber content has no effect on yarn behavior D) Only scientists can read fiber labels
4. Texture in crochet communicates meaning because: A) All textures look the same B) Different textures carry culturally shared aesthetic and functional associations C) Texture is invisible to viewers D) Only the crocheter can perceive texture
5. A well-written crochet pattern minimizes the receiver's uncertainty by: A) Being as brief as possible B) Transmitting a high-fidelity generative model of the construction process C) Only including pictures D) Leaving all decisions to the crocheter
6. US and UK crochet terminology differences illustrate: A) That terminology does not matter B) How communication breaks down when shared codes diverge C) That only one system is correct D) A purely academic problem
7. Online crochet communities enhance communication by: A) Replacing yarn labels B) Extending communicative range beyond what patterns alone can transmit C) Making all information unreliable D) Only serving experienced crocheters

Part B: Short Answer

1. Explain why it is difficult to communicate the hand feel of a yarn through text alone.
What perceptual information is lost, and how do crafters compensate?
2. Describe a crochet pattern as a model transmission. What makes the difference between a pattern that communicates clearly and one that generates confusion?
3. How does the yarn weight classification system create a shared predictive framework?
Give a specific example of how the label "DK weight" sets expectations for a crocheter.
