

Practice Quiz: Agents — Each Maker at the Table

Part A: Multiple Choice

1. In Active Inference, a **generative model** for a crocheter in a circle includes: A) Only the stitches they have memorized B) Technical knowledge, project expectations, social knowledge, and aesthetic preferences C) Only the pattern instructions they are currently following D) A fixed set of rules that never changes
2. A beginner crocheter experiences frequent **prediction error** because: A) They are not paying attention B) Their generative model is shallow, so many outcomes are unexpected C) They have chosen the wrong yarn D) The circle is teaching them incorrectly
3. The diversity of generative models in a crochet circle is best understood as: A) A problem that makes the circle inefficient B) A resource that drives collective learning and model expansion C) Something that should be minimized by teaching everyone the same techniques D) Irrelevant to the group's functioning
4. A crochet circle functioning as a **collective agent** means: A) All members must agree on everything B) The group exhibits perception, decision-making, and action at a level beyond any individual C) One dominant member controls the group D) The circle loses the individual agency of its members
5. When Priya asks Rosa for help with a cable stitch, she is: A) Admitting failure as a crocheter B) Using the social environment to update her own generative model C) Transferring her autonomy to Rosa D) Creating unnecessary prediction error
6. A quiet member who crochets without speaking during a meeting is: A) Not participating in the circle's dynamics B) Still perceiving, predicting, and updating their generative model through observation C) Wasting the circle's time D) Acting outside the Active Inference framework

7. **Autonomy within community** in a crochet circle means: A) Each member works in isolation despite being in the same room B) Each member maintains their own creative agency while benefiting from social interaction C) The group overrides individual preferences D) Members must alternate between autonomous and communal work

Part B: Short Answer

1. Describe the generative models of two hypothetical circle members who differ in a meaningful way (skill level, cultural background, or specialty). Explain how their interaction in the circle benefits both.
2. Give a concrete example of the crochet circle acting as a **collective agent** — making a decision or taking an action that no individual member makes or takes alone.
3. Why is a circle with a mix of beginners, intermediates, and experts a more effective learning environment than one where all members are at the same skill level? Use Active Inference concepts in your answer.
