

Lab: The Body Thinks Too

Objective

Explore embodied cognition through movement lab that reveals how bodily states shape thinking, decision-making, and understanding through the lens of dance, yoga, martial arts.

Prerequisites

- A quiet, comfortable space for 25 minutes
- Willingness to engage in movement lab
- No prior experience required

Part 1: Arriving (5 minutes)

Stand in a comfortable position. Shake out your hands and feet gently. Roll your shoulders. Take three breaths. Begin to sway gently, finding your body's natural rhythm of movement.

Notice: you are thinking right now. But where is the thinking happening? Is it only in your head? Scan your body for signs of cognitive activity -- tension in the forehead, a feeling in the gut, the hands wanting to gesture.

Write your response here

(Where in your body do you notice thinking happening? What is the bodily quality of your current thoughts?)

Part 2: Somatic Markers (7 minutes)

Think of a decision you are facing. Through dance, yoga, martial arts, bring one option to mind and scan your body. Notice the felt response -- openness or constriction, warmth or coolness, ease or tension. Now bring the other option to mind. What shifts?

Write your response here

(Describe the bodily responses to each option. Did your body have a preference before your mind decided?)

Part 3: Posture and Thought (7 minutes)

Explore how the body's position shapes cognition. Try thinking in a slumped posture versus an upright one versus while moving. Through dance, yoga, martial arts, notice how each configuration changes the quality of your thinking.

Write your response here

(How did posture and movement affect your thinking? What does this reveal about the body's role in cognition?)

Part 4: Reflection (5 minutes)

Through dance, yoga, martial arts, reflect on the relationship between body and mind.

Write your response here

(How does this lab change your understanding of where thinking happens? How is embodied cognition different from brain-only cognition?)

Reflection Table

Dimension	What I Noticed	Active Inference Connection
Initial awareness		Baseline generative model state
Embodied exploration		Prediction error through direct experience
Dance, yoga, martial arts lens		Course-specific perspective on cognition
Integration		Updated understanding through bodily knowing

Discussion

Consider how dance, yoga, martial arts reveals aspects of cognition that other perspectives might miss. In Active Inference, every perspective changes the precision weighting of different signals, revealing different dimensions of the same underlying process of free energy minimization.
