

Practice Quiz: Communication — Pattern Languages as Shared Code

Part A: Multiple Choice

1. US and UK crochet terminology represent: A) The same terms B) Different encoding schemes for the same generative model C) Completely different crafts D) Regional preferences with no practical impact
2. A crochet chart compared to a written pattern is: A) Always better B) A visual encoding versus a textual encoding of the same model C) Only for advanced crocheters D) A different pattern entirely
3. When crocheters report pattern errors online, they are: A) Complaining B) Contributing to distributed model validation and refinement C) Wasting time D) Being impolite
4. The standardization problem in crochet notation is: A) Already solved B) A coordination challenge between agents using different symbol systems C) Unimportant D) Only relevant to publishers
5. Pattern abbreviation standards serve to: A) Make patterns shorter B) Reduce decoding ambiguity so all agents interpret symbols the same way C) Exclude beginners D) Save printing costs
6. Video tutorials transmit model information that written patterns cannot because: A) Videos are more entertaining B) They encode motor patterns, timing, and visual demonstrations of technique C) Written patterns are always wrong D) Videos do not require reading
7. Tech editing of a pattern before publication functions as: A) Unnecessary extra cost B) Model validation ensuring the encoding accurately represents the intended generative model C) Censorship of creative expression D) Marketing strategy

Part B: Short Answer

1. A US crocheter attempts a UK pattern without realizing the terminology difference.
Describe specifically what goes wrong with the first instruction: "dc in each st across."
What stitch will they make, and what stitch was intended?
2. Explain why finished-object photos, schematics, and row-by-row instructions each transmit different layers of the same generative model. What does each layer contribute that the others cannot?
3. Describe how an active online pattern community (like Ravelry) creates a collective generative model that is richer than any individual designer's model. Give specific examples of how community feedback improves the shared model.
