

Practice Quiz: Communication

Part A: Multiple Choice

1. A crochet pattern's abbreviation system (sc, dc, ch, etc.) functions in Active Inference as: A) An external state unrelated to communication B) A shared prior — a set of conventions both writer and reader must agree on for successful model transmission C) A purely decorative feature of the pattern D) The Markov blanket of the communication system
2. The difference between US "single crochet" and UK "double crochet" (same abbreviation "sc"/"dc" for different stitches) illustrates: A) That communication always succeeds B) A potential communication failure when priors are mismatched between sender and receiver C) That patterns do not need conventions D) The irrelevance of shared language
3. A symbol chart transmits crochet pattern information primarily through: A) Sequential textual instructions B) Visual-spatial layout that mirrors the fabric structure C) Audio signals D) Proprioceptive feedback
4. In-person demonstrations in a crochet circle are rich communication channels because they transmit: A) Only textual information B) Multi-modal information: visual hand positions, verbal explanations, and real-time feedback C) No useful information D) Only sequential action orders
5. When a crochet circle member notices a neighbor's tension error and offers a correction, this is: A) Unwanted interference B) An external prediction error signal that accelerates the neighbor's model refinement C) A communication failure D) Unrelated to Active Inference
6. A pattern that includes both written instructions and a symbol chart uses redundant communication channels. This redundancy: A) Adds confusion without benefit B) Improves accuracy by allowing the reader to cross-check two different representations

of the same model C) Is wasteful and should be eliminated D) Only helps experienced crocheters

7. When a crocheter writes pattern notes sharing modifications they made, they are: A) Destroying the original pattern B) Communicating generative model updates to the community C) Ignoring the pattern entirely D) Performing active inference on the yarn

Part B: Short Answer

1. Describe how teaching a beginner to make a double crochet requires externalizing an automatic motor model into explicit communicable steps. What information is hardest to convey?
2. Compare the precision characteristics of three communication channels: a written pattern, a symbol chart, and a video tutorial. For each, identify what aspect of the generative model it conveys best and what it leaves implicit.
3. A crocheter discovers an error in a published pattern (the stitch count given does not match the instructions). Describe how they use their own generative model to detect and resolve this communication error.
