

Research Methods — Module 07: Communication —

Study Questions

1. Why is Active Inference inherently interdisciplinary? What disciplines does it span?
2. What is the "shared formal language" that bridges disciplines in Active Inference research?
3. What challenges arise when researchers from different fields collaborate on Active Inference projects?
4. How should Active Inference be communicated to (a) neuroscientists, (b) engineers, (c) clinicians?
5. What are the three most common misunderstandings about Active Inference?
6. How do you address the "unfalsifiability" critique of the Free Energy Principle?
7. What does "the brain literally calculates Bayes' theorem" get wrong?
8. What is pre-registration? Why is it important for computational modeling studies?
9. How does open-source software (pymdp, SPM, RxInfer.jl) benefit the Active Inference community?
10. What should a reproducible Active Inference analysis include?
11. What is the Active Inference Institute? What role does it play?
12. How do multi-site collaborations strengthen Active Inference research?
13. What training does a graduate student in Active Inference need across disciplines?
14. How should an Active Inference paper be adapted for different journals?
15. What challenges do reviewers face when evaluating interdisciplinary Active Inference papers?
16. How does Active Inference research benefit from data sharing?
17. What is literate programming? How does it support reproducibility?
18. Design a workshop curriculum for teaching Active Inference to clinical psychologists.
19. How can Active Inference be communicated to a general audience without jargon?
20. What is the role of philosophical analysis in an empirical Active Inference research program?
