

# Module 05: Action — Moving Mountains

## Learning Objectives

1. Understand that **Action** is moving your body to change the world.
2. Learn about **Gravity** (The invisible magnet that pulls us down).
3. Know that learning to move takes a LOT of practice (Falling is okay!).

## Introduction: The Astronaut

Babies are like astronauts on a new planet. Gravity is heavy here! Lifting a head is hard. Rolling over is a mission. Walking is like climbing a mountain. But the baby keeps trying. Why? Because they want to explore!

## Key Concepts

### 1. Motor Control (Driving the Robot)

Your brain sends signals to your muscles.

- "Left foot up."
- "Right foot down."
- "Balance!" At first, the signals are messy (Wobbly). With practice, they become clear (Smooth).

### 2. Fine vs. Gross Motor Skills

- **Gross Motor:** Big movements (Running, Jumping, Dancing). Uses big muscles.
- **Fine Motor:** Tiny movements (Drawing, Buttoning a shirt, Picking up a cheerio). Uses tiny hand muscles. Both are super important!

### 3. Gravity (The Opponent)

Gravity is always pulling you down. To stand up, you have to fight gravity. Building a block tower is a battle against gravity. When things fall, gravity wins. When they stand, YOU win!

## Activities

### Activity 1: The Floor is Lava

Place pillows on the floor. Jump from pillow to pillow. Don't touch the floor! You are using **Gross Motor Skills** and **Balance** to solve a problem.

### Activity 2: The Cheerio Challenge

Put 10 Cheerios (or beads) on a plate. Use only your thumb and pointer finger (Pincer Grasp). Move them to a cup one by one. Now try it with your **other hand**. Harder, right? This is **Fine Motor Practice**.

## Summary

Action is freedom. When we learn to control our bodies, we can conquer gravity, climb mountains, and build anything we can imagine.
