

Lab: The Prediction Box

Goal

To test your brain's prediction power and see how it handles Surprise!

What You Need

- A box.
- A heavy rock.
- A fluffy feather (or tissue).

Steps

1. The Heavy Lift

Put the rock in the box (don't show your friend). Ask your friend to lift the box. **Prediction:** "It looks like a small box, so it will be light." **Result:** "Whoa! It's heavy!" (Surprise!) Their arm muscles predicted "light," but the world said "heavy."

2. The Light Lift

Now put the feather in the box. Ask them to lift it again. **Prediction:** "Last time it was heavy, so I will pull hard!" **Result:** The box flies up! (Surprise!) Their brain updated the model ("Box = Heavy"), but the world changed ("Box = Light").

My Prediction Log

Round	What I thought (Prediction)	What Happened (Result)	Was I Surprised?
1 (Rock)	Light Box	Heavy!	YES
2 (Feather)	Heavy Box	Flying Box!	YES

What We Learned

We are always predicting how heavy things are before we touch them. When we are wrong, we feel "Surprise" and have to update our Brain Model.
