

# Module 06: Learning — Practice Power

## Learning Objectives

1. Understand how your Brain learns new moves.
2. Learn about **Practice** (doing it again and again).
3. Know that making mistakes is part of learning!

## Introduction: The Wobbly Bike

Do you remember learning to ride a bike (or tie your shoes)? At first, you were **Wobbly**.

- Brain: "I predict... we will fall!"
- Body: "Whoa!" *Crash*.

But you tried again and again.

- Day 1: Very wobbly.
- Day 2: A little wobbly.
- Day 3: Zoom! Smooth riding!

Your Brain built a new Map for "Riding a Bike." Now you don't even have to think about it. That is **Learning**.

## Key Concepts

### 1. Building the Path

Imagine walking through tall grass. The first time, it is hard. But if you walk the same way every day, you make a clear **Path**. Your brain works the same way. Practice makes the path clear and fast.

## 2. Mistakes are Good

When you fall or make a mistake, your Brain says: "Oops! Surprise!" It uses that Surprise to fix the map. "Next time, lean to the left!" If you never make mistakes, you never learn.

## 3. Muscle Memory

After lots of practice, your brain moves the muscles automatically. This is called **Muscle Memory**. You can brush your teeth while thinking about cartoons!

## Activities

### Activity 1: The Other Hand

Write your name with your "Good Hand." Easy, right? Now switch. Write your name with your "Other Hand."

- Is it messy?
- Is it slow?
- Does your brain feel funny? That is what it feels like before you have a Path!

### Activity 2: The Backward Drawing

Look in a mirror. Try to draw a circle while looking ONLY in the mirror. It is so hard! Your brain predicts "Up," but your hand goes "Down." Keep trying. Can you learn it?

## Summary

Learning takes time. Your Brain has to build new paths. Practice helps turn a "Wobbly" prediction into a "Smooth" one. Don't be afraid of mistakes—they help you learn!
