

Lab: Sink or Float?

Goal

To practice making predictions (Hypotheses) and testing them.

What You Need

- A big bowl of water or the bathtub.
- Household items (Apple, Spoon, Lego, Sponge, Rock).
- Paper and Pencil.

Steps

1. The Setup

Make a chart on the paper. Columns: **Item, Guess (Sink/Float), Result, Was I Right?**.

2. The Hypothesis

Pick up the Apple. Feel how heavy it is. Predict: Will it go down (Sink) or stay up (Float)?
Write "S" or "F".

3. The Test

Drop it in! Sploosh. What happened? (Apples float!). Write the result.

4. Repeat

Test all the items.

Discussion

- Were you surprised by any? (Sometimes heavy things like big ships float!).

- Why does the sponge float at first, then sink? (Absorption!).
- You just did Physics!

What We Learned

We don't know the answer until we test it. Being a scientist is about being curious, not just being right.
